[54]实用新型名称 一种布底鞋底

[57]摘要

本实用新型涉及一种布底鞋底,包括橡胶或塑料层,其特征是:在橡胶或塑料层的外侧有一层布面,本实用新型的优点是能增强薄型鞋底强度及增强防滑性。

ISSN 1008-4274

权 利 要 求 书

一种布底鞋底，包括橡胶或塑料层，其特征是：在橡胶或塑料层的外侧有一层布面。

说明书

一种布底鞋底

本实用新型涉及一种鞋底，特别是一种布底鞋底。

目前一般的鞋底较多是采用橡胶或塑料等材料，但是在薄底鞋底的情况下容易在缝合时出现断裂，行走时易打滑，特别是在寒冷的气候时尤为突出。

本实用新型的目的是提供一种能增强薄型鞋底强度及增强防滑性的布底鞋底。

本实用新型的技术方案是设计一种布底鞋底，包括橡胶或塑料层，其特征是：在橡胶或塑料层的外侧有一层布面。

本实用新型的优点是能增强薄型鞋底强度及增强防滑性。

下面结合附图对本实用新型作详细说明，

附图为本实用新型的剖面示意图，

图中包括橡胶1或塑料层1，其特征是：在橡胶1或塑料层1的外侧有一层布面2，制作时通过注塑，压塑，粘合等工艺将布面2固定在橡胶1或塑料层1触地一面的外侧，由于薄型底橡胶1或塑料层1的强度较低，缝合时易断裂，且当薄型底接触平滑面或遇水易打滑，而外侧有布2时，可增强缝合时的鞋底强度，且布面2遇水或平面不易打滑。

Title: Fabric Shoe Sole

Publication Date: November 15, 2000

Application Date: January 3, 2000

Abstract:

The present new utility model relates to a fabric shoe sole, including a rubber or plastic layer, characterized as: having a fabric layer outside the rubber or plastic layer. The advantage of this new model is that it increases the strength of thin shoe sole and increases anti-slippery ability.

Claim

A fabric shoe sole, including a rubber or plastic layer, characterized as: having a fabric layer outside the rubber or plastic layer.

Specification

The present utility model relates to a shoe sole, specifically a fabric shoe sole.

Presently, rubber or plastic materials are used in most shoe soles. However, when the sole is thin, it easily breaks during sewing, becomes slippery during walks, particularly under cold weather conditions.

The objective of the present model is to provide a fabric shoe sole which increases the strength of thin shoe sole and improves anti-slippery ability.

The present model provides a design for a fabric shoe sole, including a rubber or plastic layer, characterized as: having a fabric layer outside the rubber or plastic layer.

The advantage of the present model is increased strength of thin shoe sole and improved anti-slippery ability.

Below is a detailed explanation of the present model, with explanation of the figure.

The figure illustrates a cross-sectional view.

The figure includes a rubber layer 1 or plastic layer 1, characterized as: at the outside of the rubber layer 1 or plastic layer 1, there is a layer of fabric 2. During manufacturing, using processes such as injection molding, press molding, or adhesion, the fabric layer 2 is

affixed to the rubber layer 1 or plastic layer 1, at the side that touches the floor. Because thin rubber layer 1 or plastic layer 1 has low strength, it breaks easily during sewing, and becomes slippery when it touches smooth surfaces or wet surfaces. When there is a fabric layer 2 outside, the strength of the shoe sole during the sewing process is improved and also it does not become slippery when on smooth or wet surface.
